First time? It starts as **admin** / **agrirover**. Change both in Settings the moment you are in — this page may be reachable by anyone on your wifi.

LIVE - the rover working a row on its own

AUTO, job running, 33 plants done, the camera recording. The chips along the top are honest: simulation, no remote plugged in, no AI model trained yet, and the spray still locked because nobody armed the pump.

CAMERA

RECORDING

FRONT08:35:31

FRONT · driving and looking at the crop

One camera, 254 mm above the ground, 95 mm ahead of the front axle. It both follows the row and judges the plants, so keep the lens clean.

HOW IT IS DOING

MODE

Idle

Manual

Auto

Hold

Manual — your 6 channel remote drives it, or the pad below when the remote is off. Auto — it follows the row, stops at each plant and decides. Move any stick on the remote and it drops straight back to manual.

FIELD MAP - every plant it has met

33 plants, numbered r2p01 up. Look at the row bending down to the right: that is the odometry drifting, exactly as the note under the map warns. Wheel encoders are what fix it.

PLANTS - the history of each one

Every plant it has ever seen, what it decided and when. With no model trained they are all logged 'not checked' with the photo saved, which is the honest answer rather than a guess.

CHARTS - battery, soil, tank

The battery now reads 12.63 V, because the pack in the config is the 12 V lead acid one the parts list buys. Before today it was set for a 14.8 V lithium pack and would have cut the motors out instantly.

PHOTOS IT HAS TAKEN

Every plant it looks at gets photographed. Download them sorted into folders by what the rover called them, correct the wrong ones, and you have a training set of your own plants under your own light — which is the only kind worth training on.

EMERGENCY STOP

IT NEEDS YOUR ANSWER

Not checked on plant 38

There is no AI model loaded, so I did not check this plant. The photo is saved. Mark it as seen?

FRONT 08:35:49

Yes, do it

No, skip this plant

PATROLS

NOTHING SCHEDULED

A patrol only starts if the rover is parked, not stopped, has more than 40% battery and the remote is off. If any of those is not true it says so in the messages and waits for the next one. Spraying stays off unless you tick it — and the pump still has to be armed.

No patrols yet. Add one below.

WHAT IS ACTUALLY FITTED

Wheel encoders without them the distance is estimated and drifts	not fitted
Tilt sensor without it the leaning cut-out can never fire	not fitted
Front range sensor without it nothing stops it driving into something	not fitted
Soil probe without it there is no soil reading at all	not fitted
Boom valves without them nothing can be sprayed	not fitted
Drive and steering without them it cannot move	not fitted
Plant AI model without it every plant is logged as not checked	not fitted
Front camera measured working	fitted
Turning circle worked out from the steering linkage in the CAD	2.78 m

No patrol set
